

## ABSTRACT OF THE DISCLOSURE

A suction head of a vacuum cleaner with a power brush to suck foreign materials from a cleaning object being rotary abutted to the cleaning object,  
5 includes a head case connected with a cleaner body by a connecting tube having a suction hole on a lower surface, a power brush positioned in the head case and protruded toward the outside of the head case through the suction hole thus to be abutted to a cleaning object, a supporting unit fixed in the head case, for supporting the power brush to be capable of performing rotary and linear movements, a rotary operating unit installed between the supporting unit and power brush in the power brush, for rotary operating the power brush and a linear operating unit installed between the supporting unit and power brush in the power brush, for moving the power brush linearly. With the composition, the present invention can reduce the size of the suction head and improve cleaning performance by improving foreign material separating function from the cleaning  
15 object.
